

ABSTRACT

The invention relates to a crush-resistant acoustically effective floor covering for a motor vehicle, in particular a commercial vehicle, comprising a decorative layer (2) and a crush-resistant blow moulded part (3) arranged underneath the decorative layer. In order to ensure an impeccable appearance of such a floor covering and in order to attain improved acoustic effectiveness while ensuring optimum crush-resistance, it is proposed that, on the top, the blow moulded part (3) comprise an essentially closed cover plate (5) while on the bottom it comprise a structural component (6), wherein the cover plate (5) and the structural component (6) have different wall thicknesses ( $d_1$ ,  $d_2$ ). The structural component (6) comprises a plurality of box-shaped or cup-shaped hollow chambers (7) which are open on one side but closed on the underside, wherein at least some of the hollow chambers (7) which are closed off to the outside form part of a common air space enclosed between the cover plate (5) and the structural component (6). Furthermore, the structural component (6) is underfoamed with foam material (4).

Fig. 2 has been provided for the abstract.
